

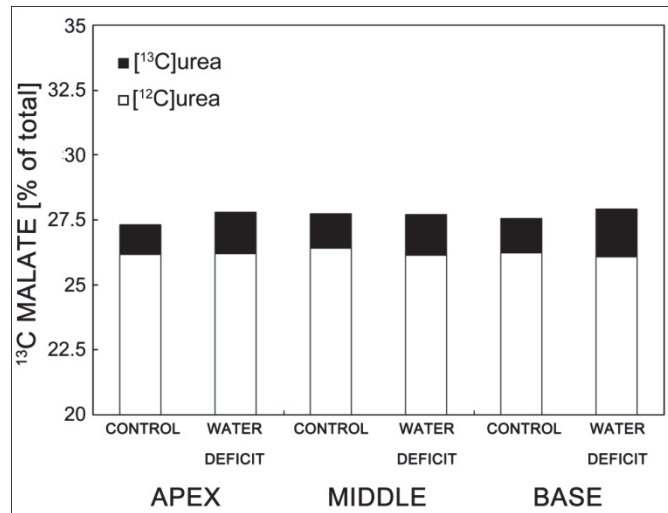

Fig. 1 Suppl. The percentage of total labeled ^{13}C malate in apical, middle, and basal leaf portions of *Guzmania monostachia* during nighttime after 8 d under well-watered (control) or water deficit treatments. *White bars* indicate the natural abundance of ^{13}C malate. *Black bars* indicate the isotopic enrichment of ^{13}C malate by CO_2 originated from urea hydrolysis. Data are means of three replicate samples.
